NOAA's Climate Prediction Center Releases Updated El Nino/La Nina Information

Today NOAA's Climate Prediction Center (CPC) released their latest information on the status of ENSO (El Nino Southern Oscillation). Here are the highlights:

- NOAA scientists declared the arrival of La Niña today, calling it present, but weak.
- It is predicted to be short-lived, possibly only lasting a few months.
- La Niña is associated with cooler-than-average sea surface temperatures in the Equatorial Pacific, which trigger changes in the atmosphere.
- You can find more detailed information on La Nina on [CPC's website](#), or on NOAA's [ENSO Blog](#).
- NOAA will issue an updated Winter Outlook on Thursday, November 17th.

WEATHER OF CONCERN

Weather of Concern

- Gradual cooling will continue through Saturday as high pressure aloft weakens over portions of Northern and Southern California.

Active Weather Warnings, Watches and Advisories by County:

http://www.wrh.noaa.gov/sto/brief/wwa_bc_cal.php

WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

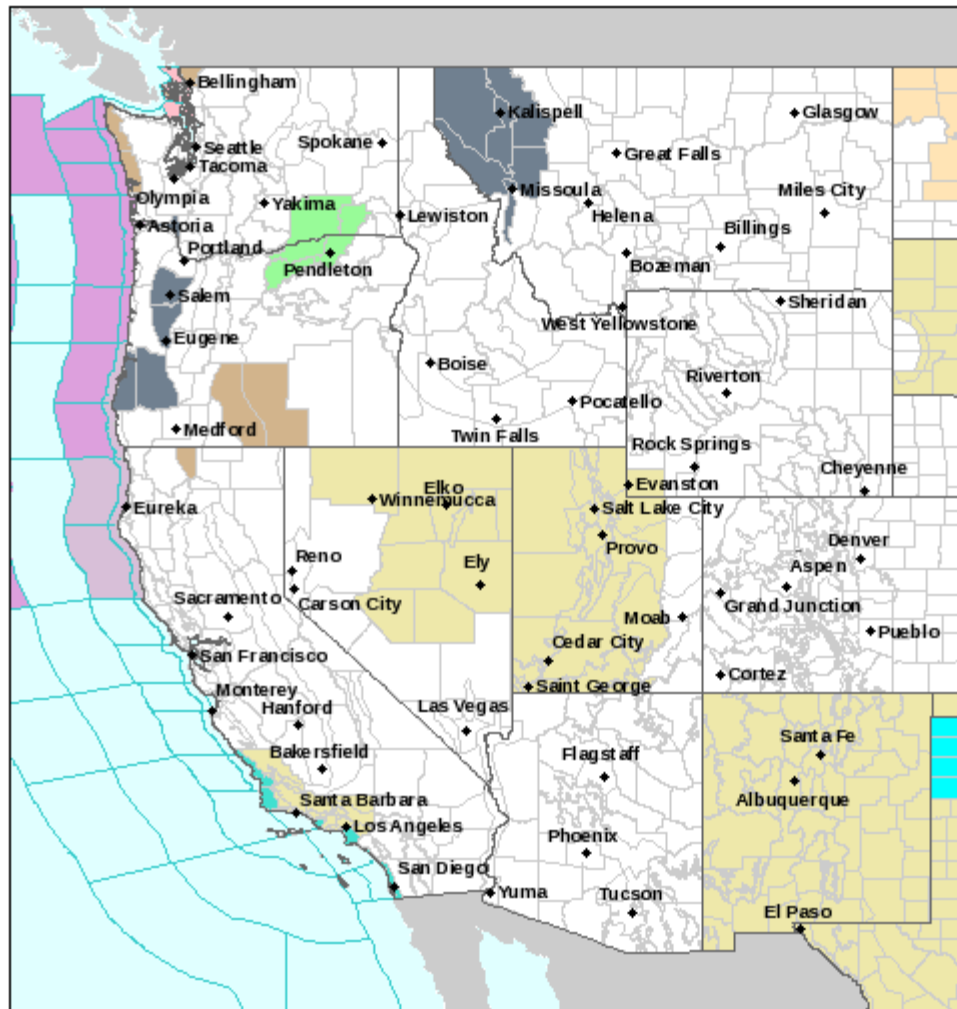

For the next several days high pressure will be over the Great Basin and Southern California and a low pressure trough will be over the eastern Pacific. This pattern will produce a steady southwest flow aloft over Northern California through Monday. For much of this time mild, dry and stable conditions will prevail and winds will be fairly light. Variable high cloudiness can be expected, and low spots from the Sacramento Valley to the coast will see patchy morning fog and low stratus. Strong inversions will form in many valleys and canyons as well. The exception to this pattern will come late today and tomorrow when a weak frontal system moves through the trough to coastal areas with light to brief moderate rainfall. Light rain showers may reach the northern Sacramento Valley and foothills by midday tomorrow before the frontal system dissipates. Southerly gusts late today and tomorrow may reach 25 mph in open wind-prone areas. Rainfall will generally reach a Santa Rosa to Redding to Montague. Rainfall totals from this system may reach 0.50-1.00 inches in far northwestern California, while other areas that receive rain will get 0.25 inches or less. A stronger system will move in Tuesday and bring rain and mountain snow to all areas through the middle of the week.

SOUTHERN CALIFORNIA

A strong ridge of high pressure aloft over California will maintain well above normal temperatures today, with mid 60s to mid 70s across the mountains and mid 80s to mid 90s in the valleys of Southern California. The valleys of Central California will be in the mid 70s to mid 80s. The ridge of high pressure will weaken bringing around 5 degrees of cooling today and another few degrees of cooling tomorrow. Temperatures will warm a few degrees Sunday and Monday as the ridge strengthens again. However, temperatures will not be as warm as what they are currently, since the flow will be neutral instead of offshore. Minimum humidity will be mainly between 15% and 30% away from the San Joaquin Valley through Monday. A Pacific trough will drop down the West Coast bringing significant cooling and a big increase in humidity Tuesday and Wednesday. This trough will bring scattered showers to Central California with light rainfall totals Wednesday. West winds of 20 to 30 mph with gusts to 50 mph will surface across the mountain ridges and desert passes Tuesday afternoon through Wednesday evening.
